

## CRTM 6

Cintal remote task monitoring system CRTM6 is a tool for monitoring applications and resources running on embedded devices. CRTM6 is the definitive process-monitoring tool for Microsoft Windows CE. It is a professional software aid that provides in depth valuable information about processes, threads, and memory on your system.

Cintal CRTM6 has great features:

- View CPU and memory usage on remote devices in real time.
- Generate reports for offline analysis.
- Offline reports help gather information from devices in the field.
- Plot data in an intuitive and data rich graphical interface.
- Debug user interface issues.
- Helps diagnose issues early in the development cycle of the project.
- Provides functions to help make development easier and aid in resolving issues quicker

Performance, reliability and efficient resource usage are all important in any application. These factors become critical when targeting embedded systems such as Microsoft Windows CE. Using CRTM6 on a regular basis during the development as well as during testing cycle of your product is the best way to ensure that your application is reliable and efficient.

CRTM6 helps fine-tune your Windows CE application, find CPU-intensive code, or even just show that your application is running smoothly. It is a simple yet powerful analysis tool.

Improve the overall quality of your product. Gain a competitive advantage. Use CRTM6 and your customers will be glad you did!
